FERODO RACE COMPOUNDS:

SinterGrip XRAC

Ferodo Racing has updated the well renown SinterGrip XRAC with an all-new formulation. Over a year in development, this new sintered metal race compound features a higher peak coefficient of friction than its predecessor while providing even more feel and modulation at the lever for greater control entering tricky corners under trail braking. A rising torque curve increases power when needed most in severe braking conditions. Improved thermal stability provides greater lap to lap consistency, allowing racers to hit the same brake marker with inspiring confidence. Also features the trademarked Array Cooling™ technology to reduce interface temperatures under severe thermal load conditions. This remarkable race compound is extremely powerful, yet marries user-friendly torque characteristics that provide late braking consistency, lap after lap.

CPro Carbon/ceramic – New!

The CPro organic series race pads replace the popular and long standing CP1 pads with an entirely new friction matrix composition technology called Carbon/ceramic. This is not a case of simply adding ceramic particulates (friction modifiers) to the mix but rather and a new and different approach how organic composition racing brake pads operate. Provides tremendous power and control at the brake lever with a consistent and predictably reassuring rising torque curve for that added power, deep into a corner – whenever you need it, time after time. Performs brilliantly on stainless and even better on our Ductile Iron brake rotors. Plus very low abrasion as well. NOTE: Requires thermal cycling for best performance.

ZRAC Racing

The Ferodo ZRAC race pad range does not replace the recently updated XRAC, but rather is a very focused and limited product range that features the trademarked *HIT*[™] (High Initial Torque) technology which simply translates into a higher initial coefficient of friction for more initial bite than the XRAC. But it doesn't stop there, this is combined with an extremely high peak friction for an amazingly powerful brake system. The intent is to offer more performance options for Pro level racing as well as seasoned club racers who prefer the characteristics of a flatter torque curve. Feel and feedback at the lever is superb providing excellent control during late braking corner entrances while it's thermally stable friction characteristics maintain linear progression to peak power under maximum pressure. As with the XRAC stablemate, the ZRAC also features the trademarked Array Cooling[™] technology to reduce interface temperatures under severe thermal load conditions.

This new product range will be limited to late model Sportbikes and Billet GP type race calipers.

SUPERFORMULA - RACING BRAKE FLUID

FERODO Super Formula exceeds the performance of traditional brake fluids:

- Typical Dry Boiling Point 330° C. - higher than any other product on the market. (626° F)
- Outstanding lubricity for smooth and efficient operation.
- Excellent viscosity index allows efficient operation at both high and low temperatures whilst remaining easy to bleed - unlike "high viscosity" competitor products.
- Fully meets the DOT 4 Specification – which is not the case with all products on the market. This allows the fluid to be used for races run on public roads.
- Last but definitely not least, the Ferodo brand and all that that implies about a product!

FSF050; Super Race Brake Fluid, 500ml, \$39.95 list
